DarkComet-RAT – Pushme notify documentation.

This function will allow you to get notified each 'X' minut by a iphone push with the selected settings chosen.

This function requires :

1- An iphone or ipod touch
2- Pushme application installed in your iphone or ipod touch
3- A Pushme.to account
4- To read through this tutorial to make sure you understand the whole functionality

    I.   WHAT IS PUSHME.TO (FROM OFFICIAL WEBSITE)

Pushme.to brings free instant messaging to your iPhone and web browser, for real-time communication with your friends with or without iPhone.

If they have an iPhone/iPod Touch, you can exchange free instant messages with images, just by knowing their nicknames. And if they do not have, they can send you free instant messages from your pushme.to/nickname web page and read your replies in real time.

Our goal is to provide you with a service that is as easy as SMS and can be used by virtually anyone with a browser. No registration is required for sending you instant messages from the web. Leave your link or install a widget anywhere on the web and talk to the world, in real time.

Why is it better than SMS?
No charges per message, international or not;
Instant images send and receive on the web or iPhone/iPod Touch;
Messages delivered on the screen but via Internet - even without network coverage with Wi-Fi;
All messages are stored in the cloud and accessible via browser.

Why is it better than competing iPhone messengers?
Real-time conversation both on iPhone and in web browser;
The sender is not required to register or own an iPhone;
No user lists and no software needed to be downloaded.

II.   SETUP PUSHME ON YOUR IPHONE

Simply go to apple store with your iphone or ipod touch and in searchbox type 'pushme' (free). Install it and it is done.

III.   CREATE A NEW PUSHME ACCOUNT

To use Pushme service on DarkComet you MUST create a new Pushme account.
Go to : http://pushme.to/ and click on register an account , just follow the steps to create a new account.

IV.   SETUP PUSHME SERVICE IN DARKCOMET-RAT

A short description of all functonalities :

- '**Active live Pushme iphone notification**' : If you check this box it will active the functionality.
- '**Your Pushme url**' : This editbox is the most important things to complete it is your unique widget url , without this my web service will not be able to identify you and send a push to your iphone :

How to get this widget API ?

To get this API you must connect on your Pushme account at : http://pushme.to/ , when logged click on 'Export widget' :

When you click in this link , a new page appear , just focus in the piece of code it gives in the right corner '3 - Get the code' you will need to select a part of this code , only copy the url as highlighted below :

Congratulations. You have gotten your API widget url and you can now paste it in the 'Your Pushme URL'.

- '**Pushme signature**' : This is your signature that will be display in the message.
- '**Send a push every**' : this spin allows you to choose the push interval in minute , I recommend to use more than 10 min to prevent being spammed all the time :p , also the min value is 1 min max is unlimited.
- '**Display number of connected servers**' : In the message you will see the number of connected servers in the SIN.
- '**Display your RAM usages**' : In the message you will see your free RAM and used RAM
- '**Display your system uptime**' : In the message you will see your system uptime
- '**Display your username**' : In the message you will see the current client username/compname (usefull if you use your push with many instance of client in more than 1 computer).

If you have any kind of problems by using this function please mail me at :
